What's New In PCWHD Compiler?

The program supports all PIC families except MCF5013, MCF5512, MCF5514 and MCF5520 MCUs. •Hardware abstractions of the following ICs: MPU, Timer, USART, SPI, ADC, A/D converters, A/D ports, CAN, CAN Frames, SPI, USB, CAN, CAN Frames, EEPROM, Flash, SONIC and SPI •Standard and legacy compiler options •Optional procedures and class libraries to support multiple debug targets •Specialized functions for creating drivers for all PIC MCUs The program also supports all popular peripherals such as Timer, A/D converters, EEPROM, Flash, SONIC and SPI. Most functions are implemented using special extension registers that are special types of the processor's general purpose registers. These registers store a special type of data (two-complement or sign-magnitude) and a special type of operation (the result of an arithmetic or logical operation) that are used in C programming. The C language provides special support for this data type (integer, floating point, etc.). These registers are used by the compiler to create the

instructions to access the hardware functions, and by the assembler to create the instructions to access the data stored in the registers. Since C programming is designed to provide easy support for programmers to create, test, and maintain applications, you don't need to be a hardware engineer to create applications. This program comes with an embedded development environment and enables you to create applications that are based on your creativity and design. Applications created with this program may be deployed for hardware target devices. It does not need a debugger. You may debug these applications using the Embedded development environment included in this program.
