If you are a new mobile developer, your success is probably very closely tied to the quality of your device’s operating system. Famed mobile application developer Michael Abrash recently discussed this topic at the “Mobile DevZone UK” conference, where he gave a talk titled “Brings us to a dead end”. He is a recognized software developer and also an author of the book “Black box engineering”. During his presentation, he showed us how an upcoming operating system by Microsoft can work with the actual hardware on which it will be installed, demonstrating how the operating system can actually alter the hardware in a way that is transparent to the user. In this presentation, he shows us how this is a huge improvement to the way in which we can work with devices. For instance, one can use his laptop to work at home, but then use a tablet in the office and get the exact same experience, regardless of what device the user is working with. Truly, it’s hard to convey what he has said in a way that will make the audience understand how important this topic is to the success of an industry that is growing at an unbelievable rate. He has definitely demonstrated that Microsoft’s next operating system will be able 77a5ca646e

Vu-Bar is a simple software utility that takes the pain out of creating a fixed size ruler for reading in browsers and text editors. Vu-Bar can be configured to measure one, two, or three lines of text. With the slider bar located at the top of the application you can change the desired width and slot height of the ruler. Vu-Bar should work perfectly in any browser with basic mouse support. For those that experience difficulties with text legibility it is recommended that the user run Vu-Bar with their web browser in full screen mode. Q: Sequential scans of file from list I have a list of files I want to process sequentially, using a java program. I've been advised I could use input and output streams to accomplish this. I have been successful at using streams to process files in sequence, but was unable to find a solution for sequential file reads from a list of files. Here is a piece of my code: //Go through the list and start processing file for(File f: listOfFiles){ FileReader reader = new FileReader(f); BufferedReader br = new BufferedReader(reader); Scanner sc = new Scanner(br); processStream(sc); } I am looking for a way to read the next file in the list, without having to keep the whole list of files in memory, and being able to re-use the current instance of Scanner for processing the next file in the list. Thanks, A: First, note that you cannot re-use the instance of Scanner; a Scanner is a stateful class. That being said, you don't need to use Scanner to read your files. You can use a read() method on a FileInputStream. As you read each file, you can output the content to a buffer (of some size) and then save the buffer to disk. Once you've reached the end of your file, you'll have saved the entire file in memory. You can read the rest of your files using the read() method on a BufferedInputStream. A BufferedInputStream is a wrapper around an InputStream; it's designed to handle many streams in a memory-efficient manner. The health effects of long-term confinement at high altitude. Altitude sickness occurs as a result of the body acclimatising to a high altitude environment and requires 3 days to recover. An individual is more susceptible at altitude than at sea level, and this increases at higher altitudes and with more chronic exposure. Hypobaric hypoxia is a key feature of acute altitude sickness; however, the cumulative effects of exposure to long-term confinement
